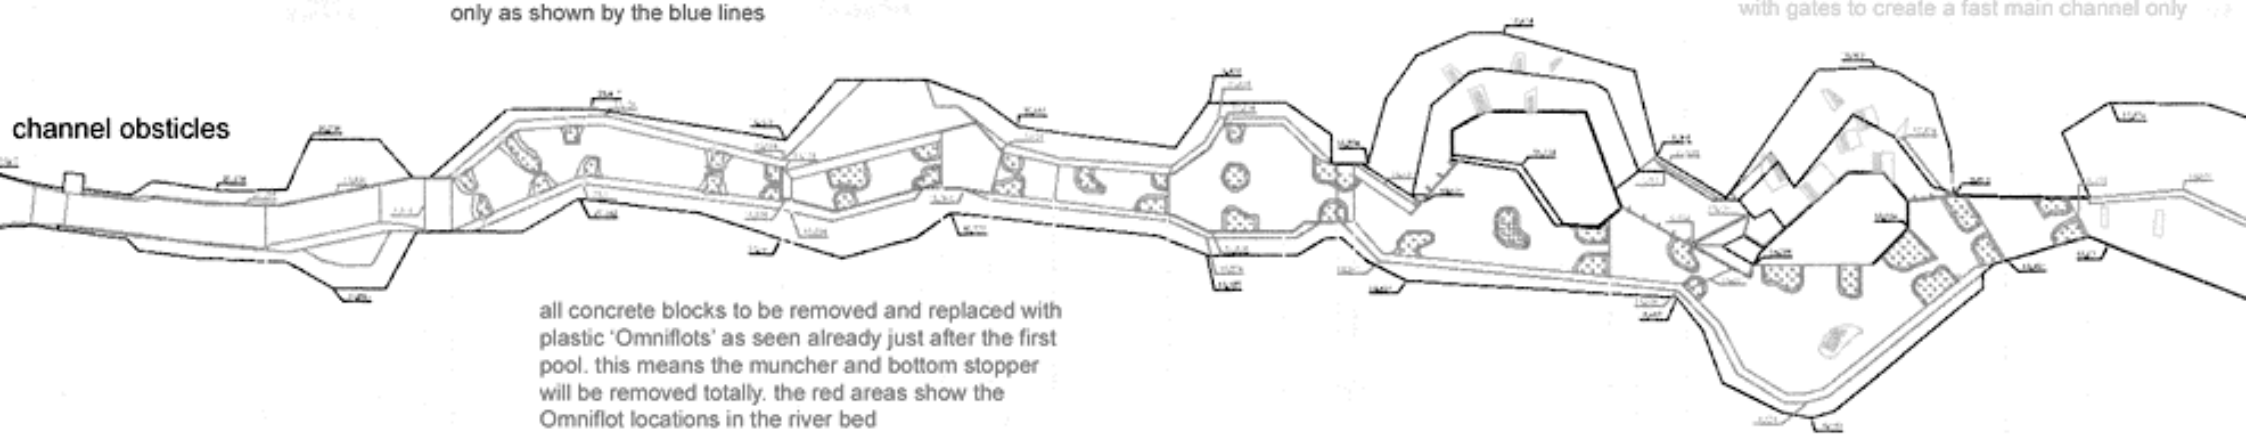
channel obsticles

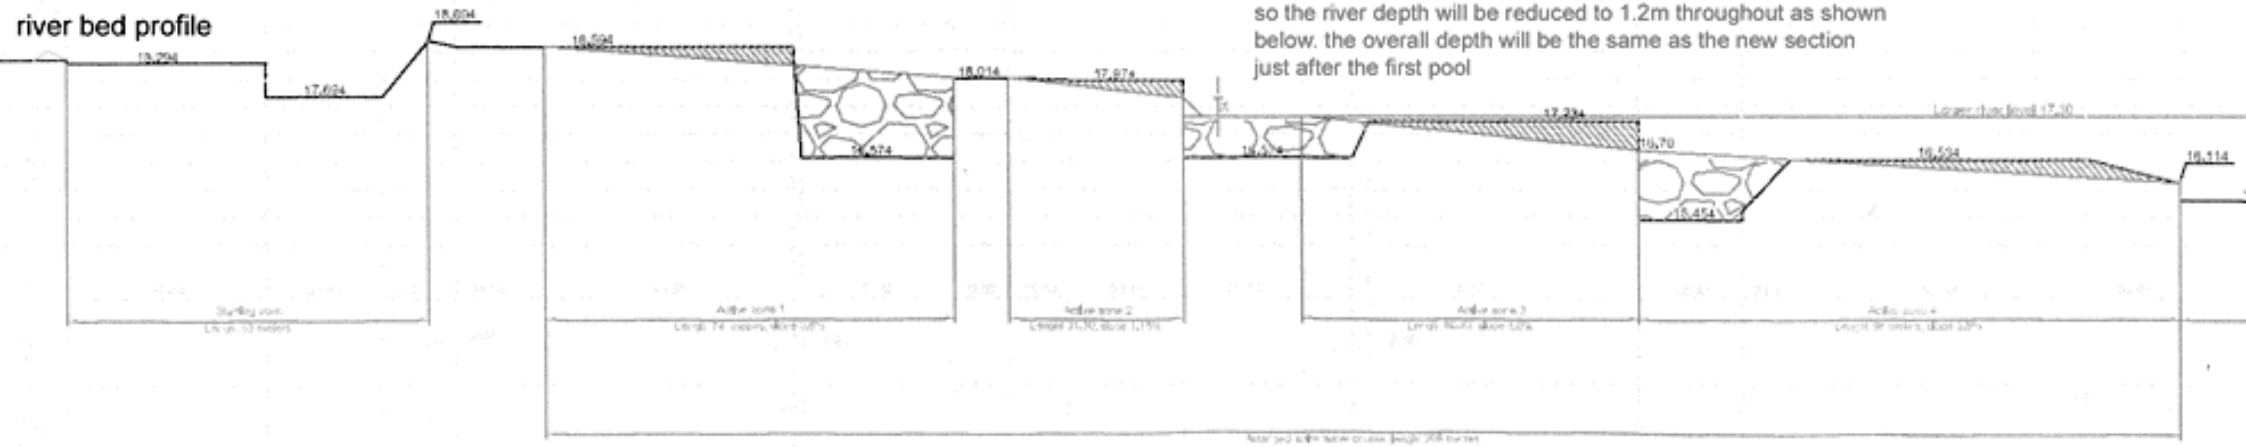
sides of the first pool and cheese block pool to be brought in to create a fast narrow channel only as shown by the blue lines

the dog leg by the muncher is to be half removed to make way for increased eddies

the chicken shoots are to be blocked off with gates to create a fast main channel only



all concrete blocks to be removed and replaced with plastic 'Omniflots' as seen already just after the first pool. this means the muncher and bottom stopper will be removed totally. the red areas show the Omniflot locations in the river bed

river bed profile


the deep pools in the course are to be filled in with concrete so the river depth will be reduced to 1.2m throughout as shown below. the overall depth will be the same as the new section just after the first pool
